RACE & AIDA

Two simple frameworks for understanding and writing better prompts

1. RACE — A Prompt Structuring Framework

RACE = Role + Action + Context + Expectation

Letter	Meaning	What it tells the AI	Example
R	Role	Who should the AI act as?	Senior Python Architect
A	Action	What should the AI do?	Review my Python code
C	Context	What background does the AI need?	RAG app using LangChain, FAISS and Ollama
E	Expectation	What should the answer look like?	Explain issues, rate severity, provide fixes

Complete RACE Example — Code Review

> **Role:** Act as a Senior Python Architect.
> **Action:** Review my Python code and identify bugs, performance issues, and bad coding practices.
> **Context:** The application is a RAG application using LangChain, FAISS, and Ollama. It will be used by employees to search company policies.
> **Expectation:** Explain each issue in simple terms, rate its severity as Low/Medium/High, and provide corrected code where necessary.

When to use RACE: Code review, data analysis, teaching, technical explanations, content creation, AI-agent design, and other tasks where you want clear instructions and structured output.

Easy memory: R = Who? A = Do what? C = What background? E = What output?

2. AIDA — A Persuasive Content Framework

AIDA = Attention + Interest + Desire + Action

AIDA was originally developed for marketing and copywriting. It can also be used in prompts when you want an AI to create persuasive content such as LinkedIn posts, advertisements, sales copy, or announcements.

Letter	Meaning	Purpose	Example
A	Attention	Grab the reader's attention	Most developers misunderstand RAG.
I	Interest	Build curiosity and understanding	RAG lets an LLM use your own documents.
D	Desire	Show the benefit or value	Build company-specific AI assistants.
A	Action	Tell the reader what to do next	Start building a RAG project.

Complete AIDA Example — LinkedIn Post

> **Attention:** Want an LLM to answer questions using your company's private documents?
>
> **Interest:** That's where RAG comes in. It retrieves relevant information from your own data and provides it to the LLM.
>
> **Desire:** This makes it possible to build AI assistants that understand company policies, manuals, and internal knowledge.
>
> **Action:** Start learning RAG with a simple FAISS + LangChain + Ollama project.

RACE vs AIDA — Quick Comparison

	RACE	AIDA
Full form	Role, Action, Context, Expectation	Attention, Interest, Desire, Action
Main purpose	Structure instructions for AI	Create persuasive content
Best suited for	Technical / task-oriented prompts	Marketing / communication
Typical use cases	Coding, analysis, teaching, agents	LinkedIn, ads, sales, campaigns
Key question	How do I clearly instruct the AI?	How do I move the reader to action?

Bottom line

RACE is best thought of as a prompt-structuring framework: it helps you tell the AI who to be, what to do, what it needs to know, and what result you want.

AIDA is primarily a marketing/copywriting framework: it helps structure communication so the reader moves from attention to interest, desire, and action. It can also be given to an AI as a content-generation framework.

These frameworks do not make the model more intelligent by themselves. Their value is in reducing ambiguity and making the intended task or communication clearer.
